AF-S Nikkor Lens Mount

The AF-S lens mount is an excellent, versatile mount for users looking for a smaller zoom lens. The minimum lens diameter for an AF-S lens is 1.5× crop, which means that when mounted on an APS-C camera, an AF-S lens will cover a 1.5× crop of the sensor area. Let's take a look at some of the AF-S lens mounts. **Figure 2.4A** : AF-S Nikkor 50mm f/1.4 lens Let's start with the 50mm f/1.4 lens on the left side of Figure 2.4A. This is the AF-S Nikkor lens for Canon and Nikon cameras. This lens uses the Nikon mount and is a true 50mm f/1.4 lens. Nikon uses a different lens mount that is very similar to the Nikkor mount. Nikon calls this the Nikkor lens mount even though it is not the same mount as the AF-S lens

One of the most used features in any photo editing software is layer editing. Layers are the basic units of manipulation in photo editing software. They can be stacked one on top of the other. Once a layer is applied to a specific image, the user can edit, move, duplicate and merge it. There are two types of layers, regular and adjustment layers. Regular layers represent the actual photo whereas the adjustment layers are used for editing purposes. Adjustment layers are a particularly useful tool for photographers or graphic designers. These layers can be used to change the tint, lighting, brightness, contrast and more. Since the adjustment layers are often applied to the photo itself, they can alter or remove certain elements of the photo. That way, users can work with the elements of the picture they want to edit.
