The MPPT is a technique for selecting a maximum power point on the basis of a result of monitoring the output of a solar battery. By the way, the solar battery has a parasitic capacitance. In order to remove the parasitic capacitance as much as possible, it is necessary to connect a capacitor to a solar battery. However, since the capacitor is an element having a parasitic resistance, an internal resistance of a solar battery increases due to the parasitic capacitance. In this case, the power source cannot be controlled on the basis of a voltage of the solar battery. For this reason, the solar battery cannot be used efficiently. In order to solve such a problem, as disclosed in Japanese Patent No. 3,420,995, there is a known technique that a first battery (series battery) to which an electric current flows in a polarity opposite
